## ANTIBIOTIC OXAZOLIDINONE DERIVATIVES

The present invention relates to antibiotic compounds and in particular to antibiotic compounds containing an oxazolidinone ring. This invention further relates to processes for  
5 their preparation, to intermediates useful in their preparation, to their use as therapeutic agents and to pharmaceutical compositions containing them.

The international microbiological community continues to express serious concern that the evolution of antibiotic resistance could result in strains against which currently available antibacterial agents will be ineffective. In general, bacterial pathogens may be  
10 classified as either Gram-positive or Gram-negative pathogens. Antibiotic compounds with effective activity against both Gram-positive and Gram-negative pathogens are generally regarded as having a broad spectrum of activity. The compounds of the present invention are regarded primarily as effective against Gram-positive pathogens because of their particularly good activity against such pathogens.

15 Gram-positive pathogens, for example Staphylococci, Enterococci, Streptococci and mycobacteria, are particularly important because of the development of resistant strains which are both difficult to treat and difficult to eradicate from the hospital environment once established. Examples of such strains are methicillin resistant staphylococcus (MRSA), methicillin resistant coagulase negative staphylococci (MRCNS), penicillin resistant  
20 streptococcus pneumoniae and multiply resistant Enterococcus faecium.

The major clinically effective antibiotic for treatment of such resistant Gram-positive pathogens is vancomycin. Vancomycin is a glycopeptide and is associated with nephrotoxicity and ototoxicity. Furthermore, and most importantly, antibacterial resistance to vancomycin and other glycopeptides is also appearing. This resistance is  
25 increasing at a steady rate rendering these agents less and less effective in the treatment of Gram-positive pathogens.

The present inventors have discovered a class of antibiotic compounds containing an oxazolidinone ring which has useful activity against Gram-positive pathogens including MRSA and MRCNS and, in particular, against various strains exhibiting resistance to  
30 vancomycin and against E. faecium strains resistant to both aminoglycosides and clinically used  $\beta$ -lactams.

We have now discovered a narrow range of compounds that is not suggested by the art and which has good activity against a broad range of Gram-positive pathogens including organisms known to be resistant to most commonly used antibiotics. In comparison with compounds described in the art (for example Walter A. Gregory et al in J.Med.Chem. 1990, 33, 2569-2578 and Chung-Ho Park et al in J.Med.Chem. 1992, 35, 1156-1165) the compounds also possess a favourable toxicological profile.

Accordingly the present invention provides a compound of the formula (I):

10

Protecting groups may be removed by any convenient method as described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with minimum disturbance of groups elsewhere in the molecule.

Specific examples of protecting groups are given below for the sake of convenience, in which "lower" signifies that the group to which it is applied preferably has 1-4 carbon atoms. It will be understood that these examples are not exhaustive. Where specific examples of methods for the removal of protecting groups are given below these are similarly not exhaustive. The use of protecting groups and methods of deprotection not specifically mentioned is of course within the scope of the invention.

20

A carboxy protecting group may be the residue of an ester-forming aliphatic or araliphatic alcohol or of an ester-forming silanol (the said alcohol or silanol preferably containing 1-20 carbon atoms).

Examples of carboxy protecting groups include straight or branched chain (1-12C)alkyl groups (eg isopropyl, t-butyl); lower alkoxy lower alkyl groups (eg methoxymethyl, ethoxymethyl, isobutoxymethyl; lower aliphatic acyloxy lower alkyl groups, (eg acetoxymethyl, propionyloxymethyl, butyryloxymethyl, pivaloyloxymethyl); lower alkoxycarbonyloxy lower alkyl groups (eg 1-methoxycarbonyloxyethyl,

Aralkoxymethyl, groups may be introduced onto the amide group by reacting the latter group with the appropriate aralkoxymethyl chloride, and removed by catalytic hydrogenation. Alkoxymethyl, tri alkyl/arylsilyl and tri alkyl/silyl groups may be introduced by reacting the amide with the appropriate chloride and removing with acid, or in the case of the silyl containing groups fluoride ions. The alkoxyphenyl and alkoxybenzyl groups are conveniently introduced by arylation or alkylation with an appropriate halide and removed by oxidation with ceric ammonium nitrate. Finally alk-1-enyl groups may be introduced by reacting the amide with the appropriate aldehyde and removed with acid.

Methods for converting substituents into other substituents are known in the art. For example an alkylthio group may be oxidised to an alkylsulfinyl or alkylsulfonyl group, a cyano group reduced to an amino group, a nitro group reduced to an amino group, a hydroxy group  
10 alkylated to a methoxy group, a hydroxy group thiomethylated to an arylthiomethyl or a heteroarylthiomethyl group (see, for example, Tet.Lett., 585, 1972), a carbonyl group converted to a thiocarbonyl group (eg. using Lawesson's reagent) or a bromo group converted to an alkylthio group.

Compounds of the formula (I) or (II) wherein  $\text{R}^1$  or  $\text{R}^{20}$  is  $-\text{NHS}(\text{O})_n$  (1-4C)alkyl  
15 can be prepared by oxidising a compound of the formula (I) or (II) with standard reagents known in the art for the oxidation of a thio group to a sulfinyl or sulfonyl group. For example, a thio group may be oxidised to a sulfinyl group with a peracid such as m-chloroperoxybenzoic acid and oxidising agents such as potassium permanganate can be used to convert a thio group to a sulfonyl group. Compounds of the formula (I) or (II)  
20 wherein  $\text{R}^1$  or  $\text{R}^{20}$  is  $-\text{NHS}(1-4\text{C})\text{alkyl}$  can be prepared by reacting compounds of the formula (III) with a reagent such as (1-4C)alkylSCl.

When  $\text{R}^b$  is (1-4C)alkyl, the group  $-\text{C}(=\text{O})(1-4\text{C})\text{alkyl}$  may be introduced into a compound of the formula (III) by standard acetylation procedures. For example, the amino group may be acetylated to give an acetamido group using the Schotten-Baumann procedure  
25 i.e. reacting the compound of the formula (I) or (II) wherein  $\text{R}^1$  or  $\text{R}^{20}$  is amino with acetic anhydride in aqueous sodium hydroxide and THF in a temperature range of  $0^\circ\text{C}$  to ambient temperature. Preferably the acylation is carried out in situ following the catalytic hydrogenation of a compound of the formula (I) or (II) wherein  $\text{R}^1$  or  $\text{R}^{20}$  is azido, by performing the hydrogenation in the presence of acetic anhydride.

30 When  $\text{R}^b$  is hydrogen, the  $-\text{CHO}$  group may be introduced into the compound of the formula (III) by reacting the latter compound with formic acetic anhydride, in an inert organic

solvent such as THF, in a temperature range of 0°C to ambient temperature, or by reacting it with ethyl formate in an inert organic solvent in the temperature range of 50-100°C.

When R<sup>b</sup> is (1-4C)alkoxy, the -COO(1-4C)alkyl group may be introduced into the compound of the formula (III) by reacting the latter compound with (1-4C)alkyl  
5 chloroformate, in the presence of an organic base such as triethylamine, in an organic solvent such as dichloromethane and in a temperature range of 0°C to ambient temperature.

When R<sup>b</sup> is amino, the -CONH<sub>2</sub> group may be introduced into the compound of the formula (III) by reacting the latter compound either with potassium cyanate in aqueous acid (eg hydrochloric acid) in a temperature range of ambient temperature to 40°C or with phenyl  
10 carbamate in glyme at reflux.

When R<sup>b</sup> is chloromethyl, dichloromethyl, cyanomethyl or methoxymethyl, the -C(=O)R<sup>b</sup> group may be introduced into the compound of the formula (III) by reacting the latter compound with the appropriate acid chloride under standard conditions. The acid chloride may be prepared from the appropriate acid. When R<sup>b</sup> is acetylmethyl, the -C(=O)R<sup>b</sup>  
15 group may be introduced into the amino compound by reacting the latter compound with diketene, in an inert organic solvent such as THF, in a temperature range of 0°C to ambient temperature.

Alternatively, the compound of the formula (III) may be reacted with the appropriate acid anhydride, in dichloromethane or THF, in the presence of an organic base such as  
20 triethylamine and in a temperature range of 0°C to ambient temperature. or the amino compound may be reacted with the appropriate acid in the presence of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and an organic base such as triethylamine, in an organic solvent such as dichloromethane, in a temperature range of 0°C to ambient temperature.

25 When R<sup>b</sup> is methylamino, the -CONHMe group may be introduced into the compound of the formula (III) by reacting the latter compound with methyl isocyanate in an organic solvent such as THF or acetonitrile, in a temperature range of 0°C to ambient temperature.

When R<sup>b</sup> is dimethylamino, the -CONMe<sub>2</sub> group may be introduced into the  
30 compound of the formula (III) by reacting the latter compound with dimethylcarbonyl

chloride and triethylamine in an organic solvent such as THF or acetonitrile, in a temperature range of 0°C to ambient temperature.

Standard reaction conditions for the conversion of a compound of the formula (III) to a compound of the formula (I) or (II) wherein R<sup>1</sup> or R<sup>20</sup> is sulfonamido are known in the art.

5 For example, a compound of the formula (III) could be converted to a compound of the formula (I) or (II) wherein R<sup>1</sup> or R<sup>20</sup> is (1-4C)alkylSO<sub>2</sub>NH- by reacting the former compound with a sulfonyl chloride, for example, mesyl chloride, in a mild base such as pyridine or triethylamine.

Alternatively compounds of the formula (I) or (II) wherein R<sup>1</sup> or R<sup>20</sup> is  
10 (1-4C)alkylSO<sub>2</sub>NH- or (1-4C)alkylSONH- may be prepared by reacting a compound of the formula (III) with a compound of the formula (IV):

(IV)

15

The compound of the formula (IV) may be prepared by oxidising a compound of the formula (IVA):

(IVA)

20 with standard oxidising agents known for the conversion of a thio group to a sulfinyl or sulfonyl group.

Compounds of the formula (IVA) can be prepared by reacting phthalimide with an alkylthiochloride ((1-4C)alkylSCl).

A compound of the formula (III) may be prepared as described in process (j).

Compounds of the formulae (V) and (VI) are conveniently reacted together in the presence of a strong base such as butyl lithium, lithium hexamethyldisilazide, sodium hydride, or lithium diisopropylamide. The reaction is conveniently carried out in an inert solvent such as tetrahydrofuran (THF), dimethylformamide (DMF), N,N'-dimethylpropyleneurea (DMPU) or N-methylpyrrolidone in a temperature range of -78°C to -50°C for the deprotonation and cyclisation. Suitable values for R<sup>21</sup> include ethyl, butyl and benzyl and suitable values for R<sup>22</sup> include ethyl and n-propyl, preferably n-propyl.

10 A compound of the formula (V) is conveniently prepared by reacting a chloroformate of the formula (ClCOOR<sup>21</sup>) with a compound of the formula (VA):

15 (VA)

wherein R<sup>2</sup> - R<sup>5</sup> and >A1-B1- are as hereinabove defined. The reaction is conveniently carried out in the presence of an inorganic or organic base such as sodium bicarbonate or an amine base such as dimethylaniline, the former in a solvent such as acetone/water and the latter in an organic solvent such as THF, toluene, DMF or acetonitrile.

20 A compound of the formula (VA) wherein >A1-B1- is >C=CH-, may be prepared by reacting a compound of the formula (VIII) with a compound of the formula (VB).

The reaction between compounds of the formulae (VIII) and (VB) wherein  $L^1$  is bromo or iodo may be carried out by treating (VB) with an organolithium species such as 1-butyl methyl in an inert solvent such as THF at a low temperature, such as  $-78^\circ\text{C}$ , followed by the addition of an anhydrous zinc halide such as zinc chloride, in a temperature range of  $0^\circ\text{C}$  to ambient temperature, to generate the organozinc chloride (VB), wherein  $L^1$  is  $\text{ZnCl}$ . Treatment of the organozinc chloride in situ with a compound of the formula (VIII) followed by a suitable palladium (0) catalyst such as  $\text{Pd}(\text{PPh}_3)_4$ , in the temperature range of  $0^\circ\text{C}$  to ambient temperature, results in the cross-coupled product (VA) after brief treatment with dilute acid to hydrolyse the 'stabase' protected amine.

- 10 A compound of the formula (VB) may be prepared by treatment of p-iodo or p-bromoaniline with the 'stabase' reagent (1,2-bis(chlorodimethylsilyl)ethane) in the presence of an organic base such as triethylamine.

The reaction between compounds of the formulae (VII) and (VIII), wherein Y is trialkyltin and  $L^1$  is triflate is conveniently carried out in the presence of a palladium (0) catalyst such as  $\text{Pd}(\text{PPh}_3)_4$  or  $\text{Pd}(\text{dba})_3$ , in a temperature range of  $0-115^\circ\text{C}$ . Preferably the trialkyltin group is trimethyltin. A suitable value for  $L^1$  is iodo or trifluoromethylsulfonyloxy.

When Y is a boronate acid or ester, the reaction may be carried out under conditions known for the Suzuki reaction i.e. in the presence of a palladium (0) catalyst such as  $\text{Pd}(\text{PPh}_3)_4$  or  $\text{Pd}(\text{dba})_3$ , in a water-miscible organic solvent such as dimethylformamide or 1,2-dimethoxyethane and in the presence of a mild base such as sodium acetate or sodium bicarbonate which is added in water. The reaction is then heated to  $80^\circ\text{C}$ . Alternatively, silver oxide may be used in place of the base, in which case the reaction may be carried out at a lower temperature. When Y is a boronate ester, preferably  $L^1$  is iodo. Suitable boronate esters include lower alkyl and cyclic boronate esters.

- 25 A compound of the formula (VII) wherein Y is trimethylstannyl may be prepared by methods known in the art (for example by using methods similar to those described in Patent Application No. WO 9413649 from a compound of the formula (VII) wherein Y is iodo or bromo). Alternatively compounds of the formula (VII) wherein Y is a cyclic boronate ester as in (VIIA):

- 34 -

(VIIA)

may be prepared from a compound of the formula (VII) wherein Y is iodo or bromo, by  
 5 sequential treatment with a suitable Pd catalyst such as  $\text{PdCl}_2(\text{dppf})$ , potassium acetate and the  
 pinacol ester of diboron in a polar solvent such as DMSO (for example see J.Org.Chem.,  
 1995, 60, 7508-7510).

A compound of the formula (VII), wherein Y is iodo may be prepared by reacting a  
 compound of the formula (VIIB) with iodine monochloride in the presence of trifluoroacetic  
 10 acid or with iodine and silver triflate:

(VIIB)

When Y is bromo, a compound of the formula (VII) may be prepared by brominating  
 15 a compound of the formula (VIIB) using standard bromination methods. For example, by  
 reacting a compound of the formula (VIIB) with N-bromosuccinimide or bromine.

A compound of the formula (VIIB) may be prepared by forming the oxazolidinone  
 ring from the amino group of a compound of the formula (VIIC) using a similar method to  
 that described for the preparation of a compound of the formula (I) or (II) from a compound of  
 20 the formula (VA):

- 35 -

(VIIC)

5 The resulting compound of the formula (VIIB) in which  $R^{20}$  is hydroxy may be converted to other compounds of the formula (VIIB) using similar methods to those described for the formation of a compound of the formula (I) or (II) from a compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is hydroxy, via a compound of the formula (III).

A compound of the formula (VIII) wherein D1 is  $R^{10}CON-$ , S or O and  $L^1$  is triflate  
 10 may be prepared by treating a compound of the formula (VIIIA) with lithium diisopropylamide in an inert solvent such as THF, at a low temperature, for example  $-78^\circ\text{C}$ , followed by N-phenyl triflamide (for example, see methods described in Synthesis, 993-95 (1991)).

(VIIIA)

Alternatively, a compound of the formula (VIII) wherein  $L^1$  is iodo may be prepared by treating a hydrazone of a compound of formula (VIIIA) with iodine in the presence of  
 20 triethylamine (for example see methods detailed in Tet. Letts., 24, 1605-1608 (1983)).

Compounds of the formula (VIII) wherein D1 is  $R^{14}CH(R^{13})(CH_2)_m-N<$ , aryl- $N<$  or heteroaryl(mono or bicyclic)- $N$  can be prepared by elaboration of the piperidone ring from the appropriate aryl- or heteroarylamines, by reaction with ethyl acrylate to give the

corresponding diethylarylimino-bb'-dipropionate, which can then be cyclised under Diekmann conditions to give corresponding piperidone  $\beta$ -ketoester, followed by decarboxylation with heating in acid (see methods described in J.Chem.Soc., 5110-5118 (1962)).

5 Alternatively, a compound of the formula (VIII) wherein D1 is heteroaryl-N< may be prepared by reacting an appropriately substituted heterocycle containing a leaving group such as chloro, bromo or iodo with the appropriate 4-piperidone at an elevated temperature, in an inert solvent and optionally with an acid trapping agent.

Suitable catalysts for the catalytic hydrogenation of a compound of the formula (I) or  
10 (II) wherein  $>A1-B1-$  is  $>C=C(R^{a1})-$  include Raney nickel, platinum metal or its oxide, rhodium, zinc oxide, palladium-on-charcoal and Wilkinson's catalyst  $(RhCl(Ph_3P)_3)$ . Catalytic hydrogenation is conveniently carried out in the temperature range  $0^\circ C$  to  $150^\circ C$ , but preferably at ambient temperature and pressure, unless Wilkinson's catalytic is used in which case a temperature of approximately  $50^\circ C$  and pressure of approximately 50 atmospheres are  
15 preferable.

A compound of the formula (IX) may be prepared by reacting an intermediate of the formula (VB) with magnesium to form a Grignard reagent, or alternatively with n-butyl lithium to form a lithiated species (as above), and then reacting the Grignard reagent or lithiated species with a compound of formula (VIII A). The product (VA), wherein  $>A1-B1-$   
20 is of the formula  $>C(OH)CH(R^a)-$  may then be elaborated as previously detailed for the compound of the formula (V), but with optional protection of the hydroxyl group.

The dehydration of a compound of the formula (IX) to give a compound of formula (I) or (II) wherein  $>A1-B1-$  is of the formula  $>C=CR^{a1}-$  may be carried out using agents such as polyphosphoric acid, trifluoroacetic acid, trifluoroacetic anhydride, p-toluenesulfonic  
25 acid, sulfuric acid, thionyl chloride etc., in an inert solvent such as toluene, and at elevated temperatures. Suitable protection of the group  $R^{20}$  may be necessary as appropriate.

A compound of the formula (I) or (II) wherein  $>A1-B1-$  is of the formula  $>CHCH(R^{a1})-$  may be prepared from a compound of the formula (I) or (II) wherein  $>A1-B1-$  is  $>C=CR^{a1}-$ , by catalytic hydrogenation, using a suitable catalyst such as palladium-on-  
30 carbon in an appropriate inert or acidic solvent such as acetic acid. Where an optically active form of compounds of the formula (VI) is used in previous steps, reduction of the  $>A1-B1-$

double bond will produce diastereoisomers which may be separated. Where a particular diastereoisomer is of choice, a chiral asymmetry-inducing catalyst for the reduction can be used.

The reaction between a compound of the formula (X) and (XI) or (XII) is  
5 conveniently carried out under similar conditions to those described for the acetylation or sulfonylation of a compound of the formula (III).

A compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is azido may be prepared, for example, by reacting a compound of the formula (XIII) with sodium azide in an inert solvent such as DMF in a temperature range of ambient to  $100^\circ\text{C}$ , normally in the region of  
10  $75^\circ\text{C}$  -  $85^\circ\text{C}$ . A compound of the formula (XIII) may be prepared by converting the hydroxy group in a compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is hydroxy into a tosyloxy or mesyloxy group by standard methods known in the art. For example, by reacting the compound of the formula (I) or (II) with tosyl chloride or mesyl chloride in the presence of a mild base such as triethylamine, or pyridine.

15 Suitable reducing agents for reducing azido to amino in a compound of the formula (I) or (II) include triethylamine/hydrogen sulfide, triphenylphosphine or phosphite ester, or hydrogen in the presence of a catalyst. More specifically the reduction of the azido group may be carried out by heating it in an aprotic solvent, such as 1,2-dimethoxyethane, in the presence of  $\text{P}(\text{OMe})_3$ , and subsequently heating in 6N aqueous hydrochloric acid, or reacting it  
20 with hydrogen in the presence of palladium on carbon in a solvent such as DMF or ethyl acetate. For further details on the reduction of azides to amines see USP 4,705,799. The azido compound may be reduced and converted to a compound of the formula (I) or (II), wherein  $R^1$  or  $R^{10}$  is acetamido, in situ using acetic anhydride in DMF.

A compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is fluoro may be prepared  
25 by reacting a compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is hydroxy (hydroxy compound) with a fluorinating agent such as diethylaminosulfur trifluoride in an organic solvent such as dichloromethane in the temperature range of  $0^\circ\text{C}$  to ambient temperature.

A compound of the formula (II) wherein  $R^{20}$  is of the formula  $-N(CO_2R^{27})CO(1-$   
10 4C)alkyl is conveniently prepared by reacting a compound of the formula (I) and (II) wherein  $R^1$  or  $R^{20}$  is hydroxy with an amide of the formula  $HN(CO_2R^{27})CO(1-4C)alkyl$  under Mitsunobu conditions. For example, in the presence of tri-n-butylphosphine and 1,1'-(azodicarbonyl)dipiperidine in an organic solvent such as THF, and in the temperature range 0°C - 60°C, but preferably at ambient temperature. Details of analogous Mitsunobu reactions  
15 are contained in Tsunoda et al, Tet. Letts., 34, 1639, (1993). Amides of the formula  $HN(CO_2R^{27})CO(1-4C)alkyl$  may be prepared by standard procedures of organic chemistry which are within the ordinary skill of an organic chemist.

A compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is chloro may also be prepared from a compound of the formula (XIII), by reacting the latter compound with lithium  
20 chloride and crown ether, in a suitable organic solvent such as THF, in a temperature range of ambient temperature to reflux. A compound of the formula (I) or (II) wherein  $R^1$  or  $R^{20}$  is (1-4C)alkylthio or (1-4C)alkoxy may be prepared by reacting the compound of the formula (XIII) with sodium thio(1-4C)alkoxide or sodium (1-4C)alkoxide respectively, in an alcohol or THF, in a temperature range of 0°C to reflux.

25 It is also possible to convert one  $R^7$  group into another  $R^7$  group as a final step in the preparation of a compound of the formula (I) or (II) (see the specific examples).

When an optically active form of a compound of the formula (I) is required, it may be obtained by carrying out one of the above procedures using an optically active starting material, or by resolution of a racemic form of the compound or intermediate using a standard

### Antibacterial Activity

The pharmaceutically-acceptable compounds of the present invention are useful antibacterial agents having a good spectrum of activity in vitro against standard Gram-positive organisms, which are used to screen for activity against pathogenic bacteria. Notably, the  
25 pharmaceutically-acceptable compounds of the present invention show activity against enterococci, pneumococci and methicillin resistant strains of *S. aureus* and coagulase negative staphylococci. The antibacterial spectrum and potency of a particular compound may be determined in a standard test system.

The antibacterial properties of the compounds of the invention may also be  
30 demonstrated in-vivo in conventional tests. No overt toxicity or other untoward effects are observed when compounds of the formula I are so tested.

The following results were obtained on a standard in-vitro test system. The activity is described in terms of the minimum inhibitory concentration (MIC) determined by the agar-dilution technique with an inoculum size of  $10^4$  CFU/spot.

Staphylococci were tested on agar, using an inoculum of  $10^4$  CFU/spot and an incubation temperature of  $37^\circ\text{C}$  for 24 hours - standard test conditions for the expression of methicillin resistance.

Streptococci and enterococci were tested on agar supplemented with 5% defibrinated horse blood, an inoculum of  $10^4$  CFU/spot and an incubation temperature of  $37^\circ\text{C}$  in an atmosphere of 5% carbon dioxide for 48 hours - blood is required for the growth of some of the test organisms.

**Examples 55 to 98 : Carboxamides**

Using a similar procedure to that described in Example 35, but starting with the appropriate  
5 carboxylic acid instead of 4-tert-butylhexanecarboxylic acid the following compounds of  
the formula XIV (Table A) were prepared by robotic synthesis (using a robot machine  
manufactured by Zymark). The procedure used is described below.

The TFA salt of Example 2 in DMF (0.75mM, 4ml) was added to the appropriate carboxylic  
10 acid (0.863mM) under argon. To this was then added a solution of N-methylmorpholine in  
DMF (1mM, 1ml) and a solution of N-hydroxybenzotriazole in DMF (0.863mM, 1ml). The  
mixture was then stirred at ambient temperature for 5 minutes after which time a solution of  
1-ethyl-3-dimethylaminopropyl-carbodiimide (EDC) in DMF (0.863mmole, 3ml) was added.  
The reaction was then stirred at ambient temperature overnight. The solvent was evaporated  
15 using centrifugal evaporation (SAVANT AES2000) using radiant cover for 3 hours. The  
residue was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (5ml). The organics were sequentially washed with 1N HCl  
(4ml), water (4ml), saturated NaHCO<sub>3</sub> (4ml) and brine (5ml). The solvent was again removed  
by centrifugal evaporation (SAVANT AES2000) using low heat for 3 hours and the products  
transferred into 16x49mm vials.

20 The less pure products were subjected to further purification by Bondelut Chromatography  
using conditions comparable to those of the TLC system used in earlier Examples ie. 5-10%  
MeOH / CH<sub>2</sub>Cl<sub>2</sub>. The relevant fractions were combined and the solvent removed by  
centrifugal evaporation (SAVANT AES2000) on low heat for 3 hours. The products were  
then transferred into 16x49mm vials.

The compounds were analysed by mass spectroscopy and were characterised by HPLC  
retention time, using the HPLC conditions described in Example 35.
